to location 0

2. Search the minimum element in the list
3. Swap with value at location MIN
4. Increment MIN to point to next element
5. Repeat until list is sorted

PROGRAM:

```
for step in range(size):
    min_idx = step
    for i in range(step+1, size):
        # to sort in descending order,
        change > to < in this line
        # select the minimum element
        in each loop
        if array[i] < array[min_idx]:
            min_idx = i
        # put min at correct position
        (array[step], array[min_idx])
             = (array[min_idx],
                   array[step])
n = int(input("Enter the number
  of elements in the array"))
```

```
for i in range(n):
    num = int(input("Enter the
        number to be inserted
         in the array"))
    data.append(num)
size = len(data)
selectionSort(data, size)
print("Sorted Array in
         Ascending order")
print(data)
```

To implement the selection sort algorithm in C

ALGORITHM:

1. Set MIN to location 0
2. Search the minimum element in the list
3. Swap with value at location MIN
4. Increment MIN to point to next element
5. Repeat until list is sorted

PROGRAM:

```
for step in range(size):
  min_idx = step
  for i in range(step+1, size):
    # to sort in descending order,
      change > to < in this line
    # select the minimum element
      in each loop
    if array[i] < array[min_idx]:
      min_idx = i
    # put min at correct position
    (array[step], array[min_idx])
          = (array[min_idx],
                array[step])
n = int(input(" Enter the number
  of elements in the array"))
for i in range(n):
  num = int(input(" Enter the
    number to be inserted
    in the array"))
  data.append(num)
size = len(data)
selectionSort(data, size)
print(" Sorted Array in
        Ascending order")
print(data).
```
