

ALGORITHM:

1. Starting with the first element (index = 0), compare the current element with the next element of the array.
2. If the current element is greater than the next element of the array, swap them.
3. If the current element is less than the next element, move to the next element.
4. Repeat Step 1.

PROGRAM:

Creating a bubble sort function

```
def bubble_sort(lst1):
```

```
    for i in range(0, len(lst1)-1):
```

```
        for j in range(len(lst1)-1):
```

```
            if lst1[j] > lst1[j+1]:
```

```
                temp = lst1[j]
```

```
                lst1[j] = lst1[j+1]
```

```
                lst1[j+1] = temp
```

```
            print("The intermediate  
                lst is", lst1)
```

```
    return lst1
```

```
lst1 = []
```

```
n = int(input("Enter the number  
of elements in the array"))
```

```
for i in range(n):
```

```
    num = int(input("Enter the  
    number to be inserted in array"))
```

```
    lst1.append(num)
```

```
print("The unsorted lst is:",  
      lst1)
```

```
print("The sorted lst is:",  
      bubble_sort(lst1))
```
